

Cost of Production for Processed Oranges in Southwest Florida in 2022/23

Ariel Singerman, Associate Professor and Extension Economist University of Florida, IFAS CREC, Lake Alfred, Florida

This article presents estimates for the cost of production per acre for processed oranges grown in southwest Florida in 2022/23. The estimates were obtained by surveying growers by mail regarding the costs of their production programs, which allows reporting representative estimates of the current grove caretaking practices, input combinations, and costs in commercial operations. This is important because, since the outbreak of HLB, growers have been changing their practices from season to season in an attempt to cope with the disease. Thus, surveying growers allows not only to report estimates that closely reflect their cost but also to track the changes they make to their cultural practices. However, the cost estimates below do not represent any individual operation. Instead, their purpose is to serve as a benchmark for the Florida citrus industry.

The number of acres managed by the combined operations of the sample of participating growers accounted for approximately 44,390 acres; representing 24% of the acreage devoted to oranges in Southwest Florida, which was estimated at 184,488 (USDANASS 2023). The questionnaire asked growers to provide annual, per acre costs by program for a "typical" irrigated, mature grove (10+ years old), including costs related to their tree replacement program. The figures below were obtained by computing the weighted average of the responses by the acreage of each of the growers.

Table 1 shows the cultural cost of production by program. The estimates include both the cost of materials and the cost associated with their application. The total cost for weed management —which includes chemical and mechanical mowing as well as herbicides— was \$209.74 per acre. At \$521.50 per acre, foliar sprays represented the largest cost. Fertilizer was the second-largest expense at \$474.67 per acre. The expense for pruning was \$42.50 per acre, while that for irrigation was \$221.33 per acre. New this season is the expense of bactericides injection, which was \$212.00 per acre. Adding all the costs listed above, the cultural cost of growing oranges for processing without tree replacement was \$1,681.74 per acre.

Growers were also asked to provide details regarding their reset practices, including the number of trees replaced in their groves. On average, growers replaced eight trees per acre during 2022/23. The total cost of tree replacement, including tree removal, site preparation, and supplemental care of those six young trees was estimated at \$140.67 per acre. Adding such figure to the total cost above adds up to a total production cost with tree replacement of \$1,822.40 per acre.

Figure 1 depicts a double pie chart. The larger pie shows the cost of each program as well as the percentage relative to the total cultural production costs with tree replacement. The smaller pie in Figure 1 provides greater detail regarding the individual components included in foliar sprays. Insecticides accounted for \$150 per acre (which represented 8% of the cultural cost of production); fungicides accounted for \$98 per acre (5%); foliar nutritionals for \$125 per acre (7%); ground application totaled \$149 per acre (8%).

In addition to cultural costs, growers typically have to incur in other costs when managing their groves. Those costs include management, regulatory, and opportunity costs and totaled \$751.48 per acre. Table 2 shows the total cost of production for processed oranges grown in southwest Florida during 2022/23 was \$2,573.89 per acre. Based on this estimate, the break-even prices per box and per pound solids for different levels of yield are presented in Table 3. Break-even prices were calculated on an on-tree and delivered-in basis. The latter takes into account that harvesting costs per box were estimated at \$4.17 for early and mid-season and \$4.46 for Valencias. The calculations in Table 3 also include the Florida Department of Citrus (FDOC) assessment of \$0.12 per box for the 2022/23 season. Thus, for example, the on-tree and delivered-in break-even prices for early and mid-season for covering the total costs of production with yield at 100 boxes per acre were \$5.18 and \$6.04 per pound solids, respectively. For Valencias, the on-tree and delivered-in break-even prices for covering the total costs of production with yield at 100 boxes per acre were \$5.06 and \$5.96 per pound solids, respectively.

Summary

This article presents a summary of the 2022/23 costs of production for processed oranges grown in southwest Florida. The methodology to collect the data consisted of surveying growers directly to reflect their costs. The main change this season was the adoption of oxytetracycline injections to treat HLB infected trees. The cultural cost and total cost of production for processed oranges this season were \$1,822.40 per acre and \$2,573.89 per acre, respectively. Typical users of these estimates include growers and consultants, who use them as a benchmark; property appraisers, who use them to compute the taxes for property owners; and researchers, who use the estimates to evaluate the economic feasibility of potential new technologies.
